

Perceived neighborhood  
safety and social support  
during childhood and its  
impact on mental health

# PLACE MATTERS

A GIS analysis of children's population health needs and resources in Philadelphia

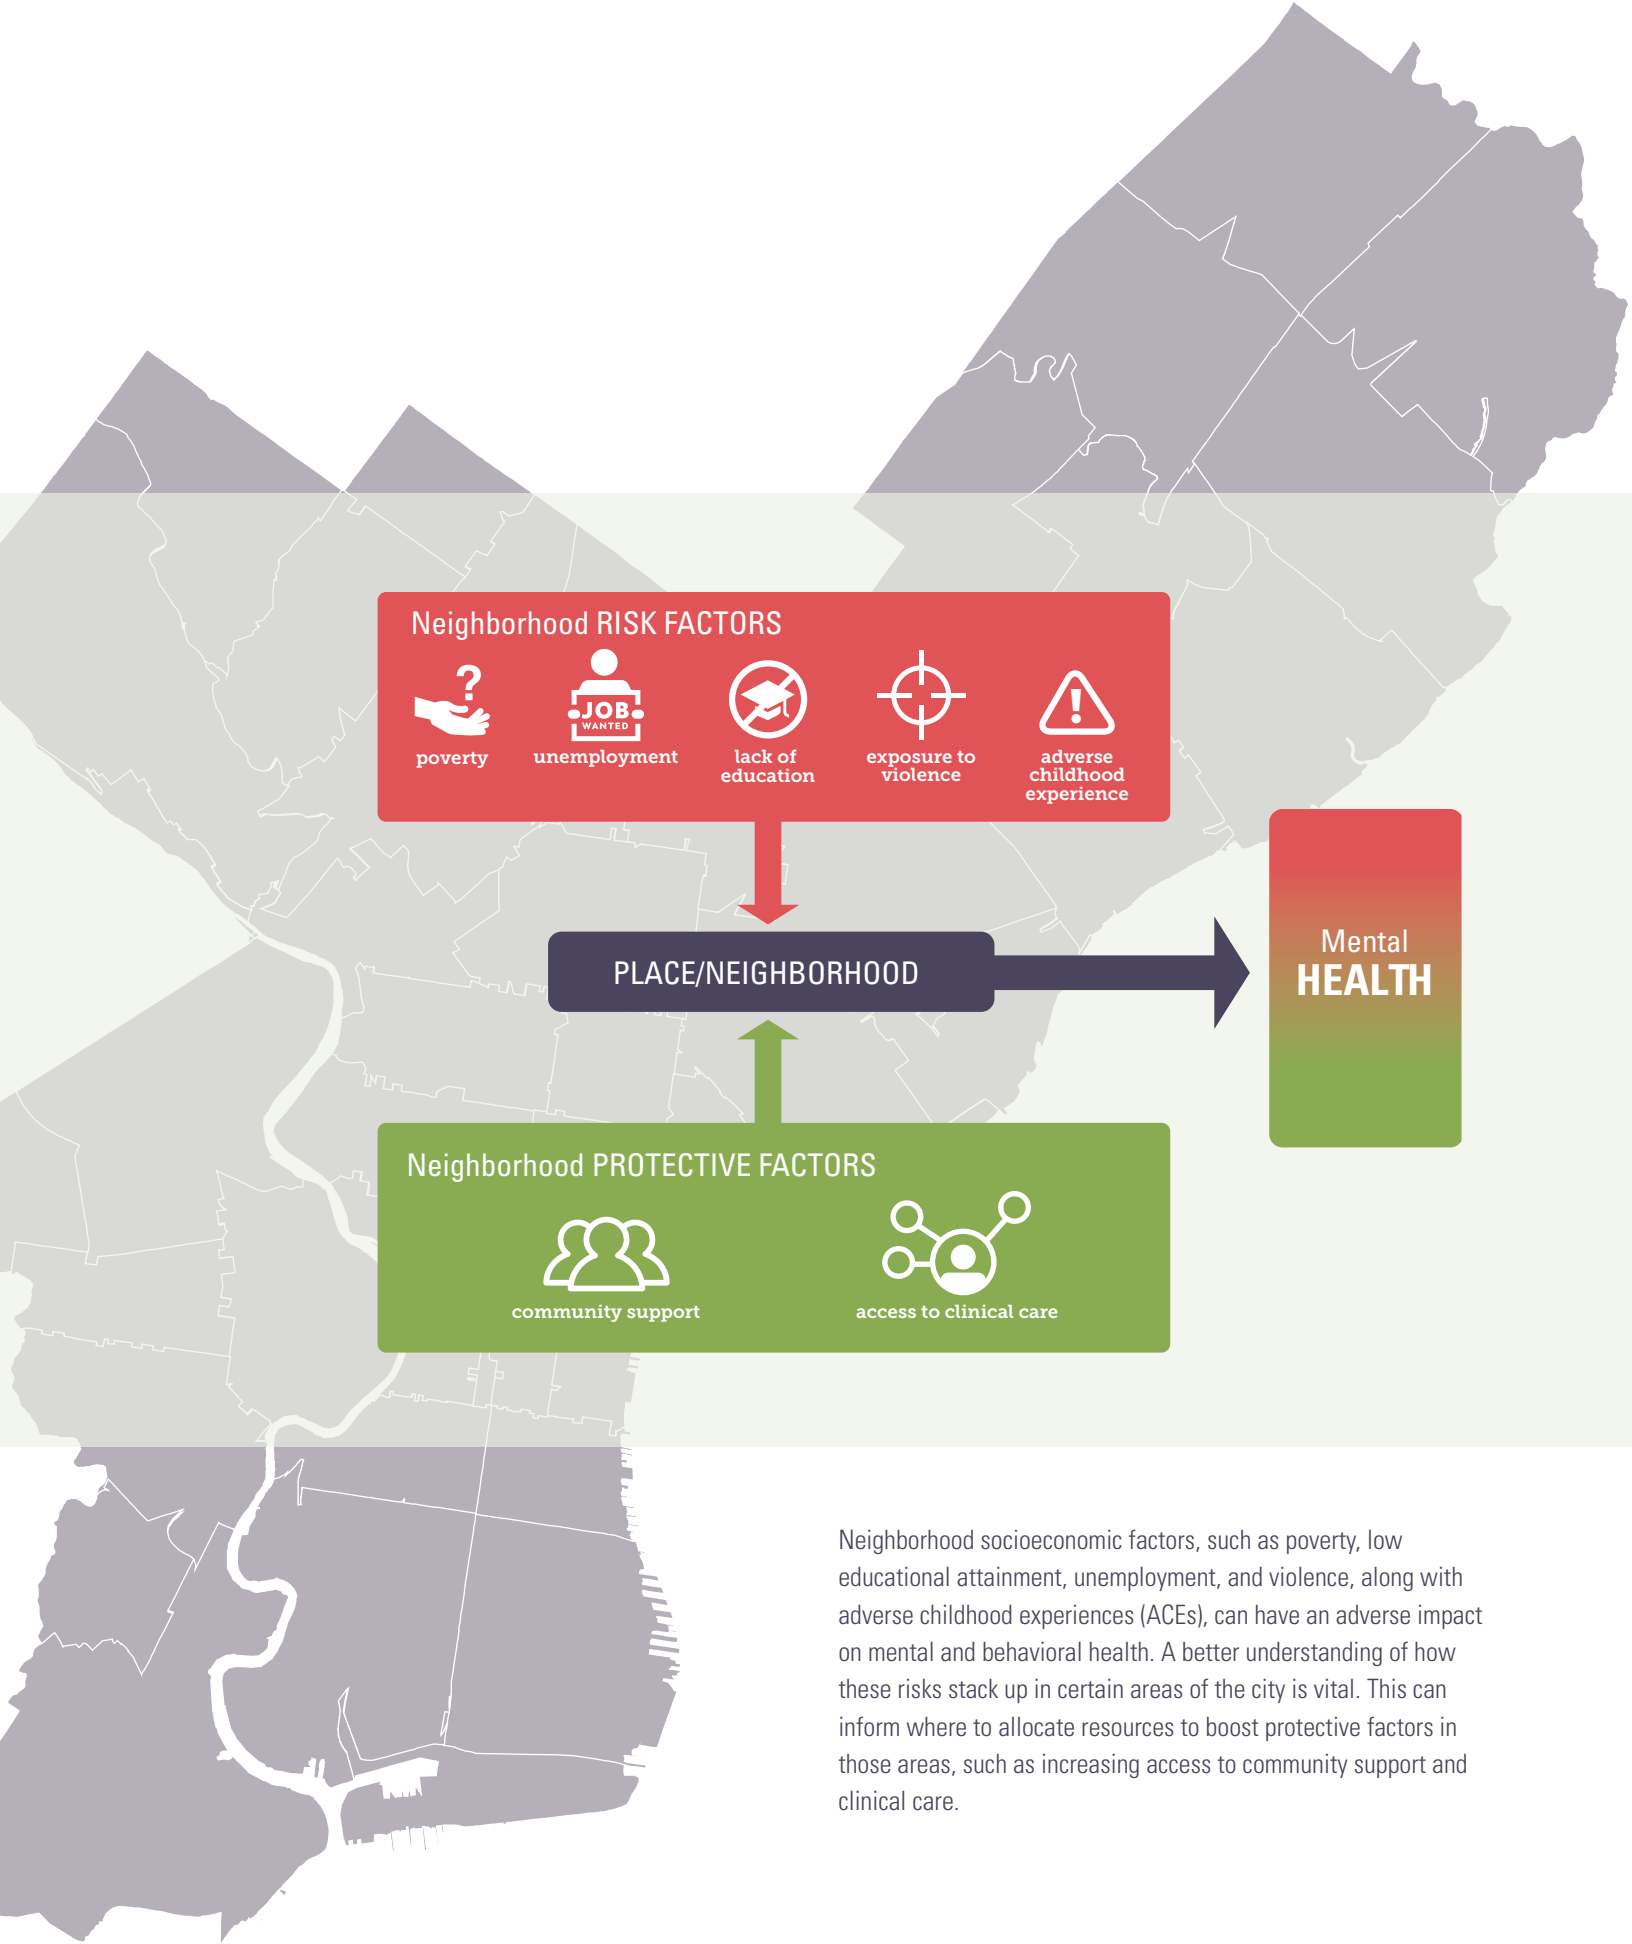

SCATTERGOOD  
FOUNDATION

City of Philadelphia  
 **DBHIDS**  
DEPARTMENT of BEHAVIORAL HEALTH  
and INTELLECTUAL disability SERVICES

Neighborhood level traits such as poverty, lower education, and high crime are linked with worse mental health outcomes. Social capital, or neighbors that watch out for each other, can protect against the negative impact of neighborhood deterioration. Less is known about how perceived neighborhood trust and safety protects against mental illness.

This project uses statistical and spatial (mapping) analyses to better understand the impact of changeable neighborhood characteristics on mental health, and proposes a way to use population level risk factors to assess service need and adequacy of community resources.

For the first time, a multiple risk factor index is used to determine higher levels of need across the city of Philadelphia. This work has implications for the behavioral health system, as well as can guide policy and planning for other social and city services.

### Neighborhood RISK FACTORS

poverty

unemployment

lack of  
education

exposure to  
violence

adverse  
childhood  
experience

PLACE/NEIGHBORHOOD

### Neighborhood PROTECTIVE FACTORS

community support

access to clinical care

Mental  
**HEALTH**

Neighborhood socioeconomic factors, such as poverty, low educational attainment, unemployment, and violence, along with adverse childhood experiences (ACEs), can have an adverse impact on mental and behavioral health. A better understanding of how these risks stack up in certain areas of the city is vital. This can inform where to allocate resources to boost protective factors in those areas, such as increasing access to community support and clinical care.

# Where are the high risk areas?

Zip codes were assigned a composite risk ranking based on five factors:

**POVERTY**

% of families with children below poverty level

+

**EDUCATION**

% less than 9th Grade

+

**UNEMPLOYMENT**

% Unemployed

+

**CRIME**

Shooting victims per 10,000

+

**ACE Rank**

% with at least one ACE

**COMPOSITE RISK RANK**

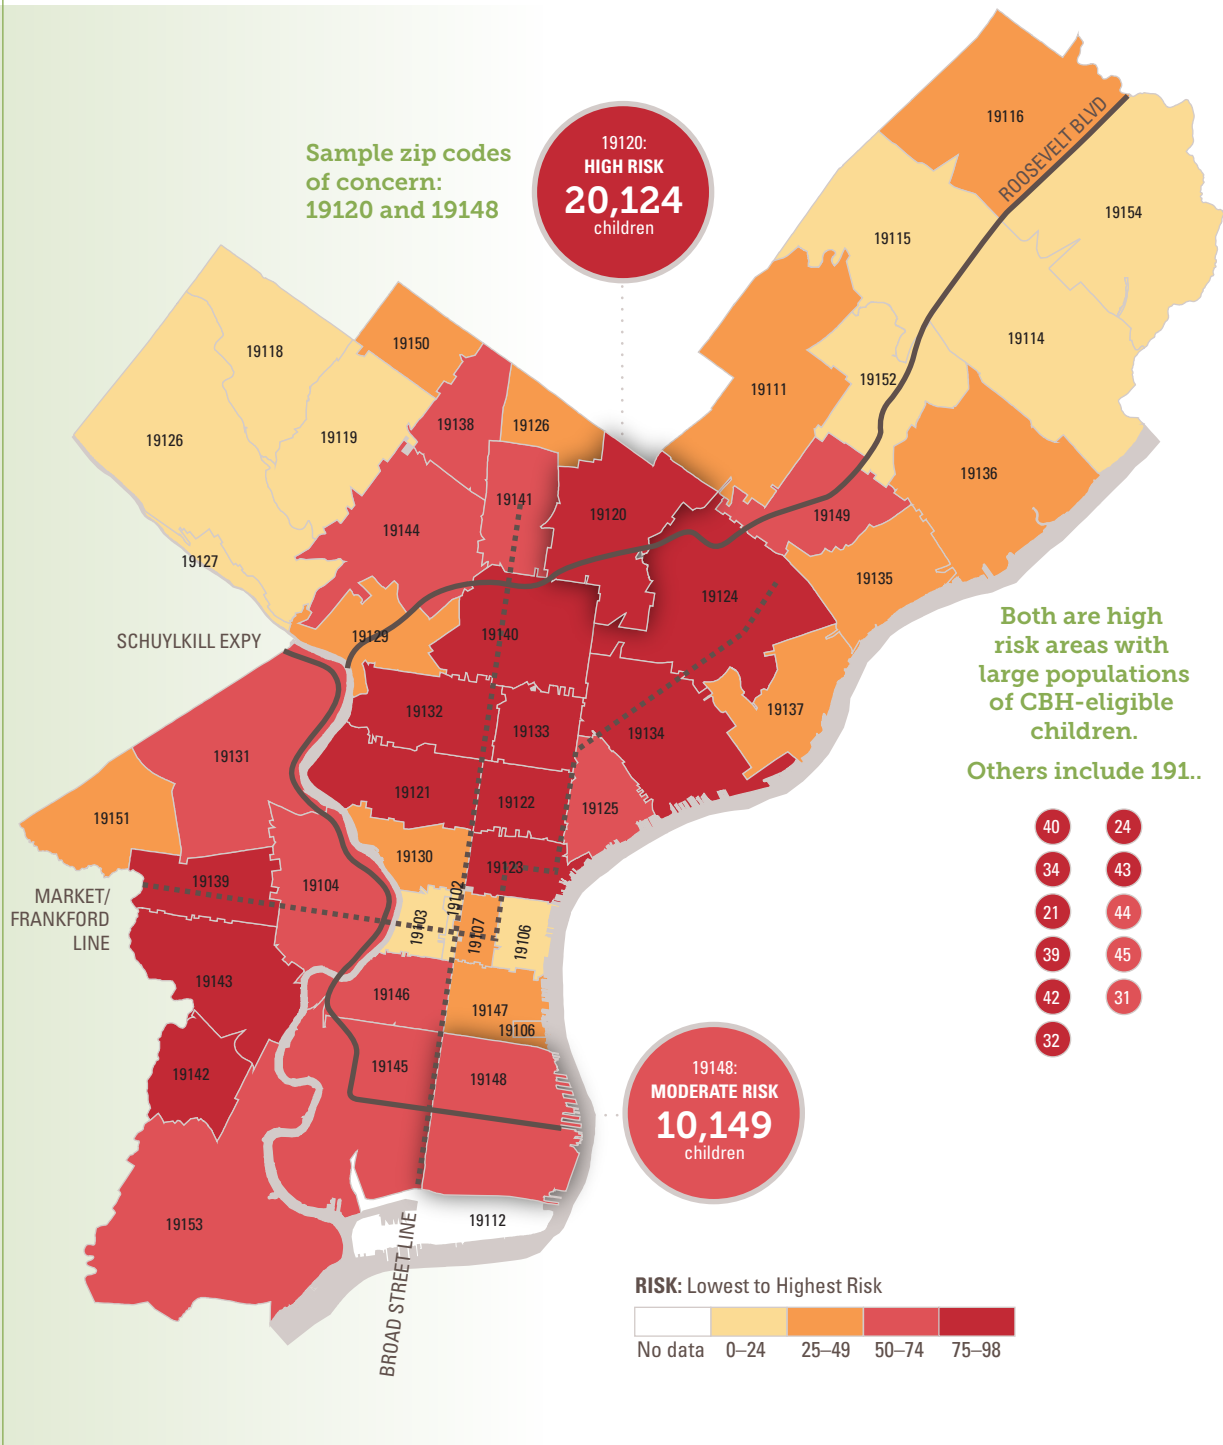

**DATA SOURCES:**

2015 unique members eligible and served from Community Behavioral Health

2013 population data form the biannual Census Updates and Projections. Provided by Nielsen-Claritas, Inc., and prepared by Public Health Management Corporation's Community Health Database.

Statistical analysis (multivariate logistic regression) used data from the 2013 Philadelphia Expanded Adverse Childhood Experience (ACE) Survey to test the impact of perceived neighborhood trust and safety during childhood, witnessing violence during childhood, and overall adverse childhood experiences on the reported mental health of Philadelphia adults.

A secondary GIS analysis used zip code-level Census, crime, and ACE data to calculate multifactorial Risk Index scores to identify areas of higher need.

## HIGH RISK AND HIGH POPULATION

Five of the 7 zip codes in the 25th highest percentile for risk also have the highest numbers of children in Philadelphia and large percentages of Medicaid-eligible children.

### Children 0-17

## GREATER RISK THAN AVERAGE

Of Philadelphia's 46 zip codes, 39 (85%) fall above national average for need, and 7 (15%) fall below national average for need.

### Risk deviations from national average

Greater risk than national average

## Comparison by Risk Factor

### COMPOSITE RISK RANK BY ZIP CODE

		POVERTY	EDUCATION	UNEMPLOYMENT	CRIME	ACEs

Shading indicates scores that are worse than national averages

# Where are behavioral health services located?

Total population of children

**346,863**

CBH eligible children

**272,223**

Total children served by CBH network in 2105

**33,378**

Children served by non-hospital mental health services in 2015

**31,778**

Total sites

**103**

Total providers

**53**

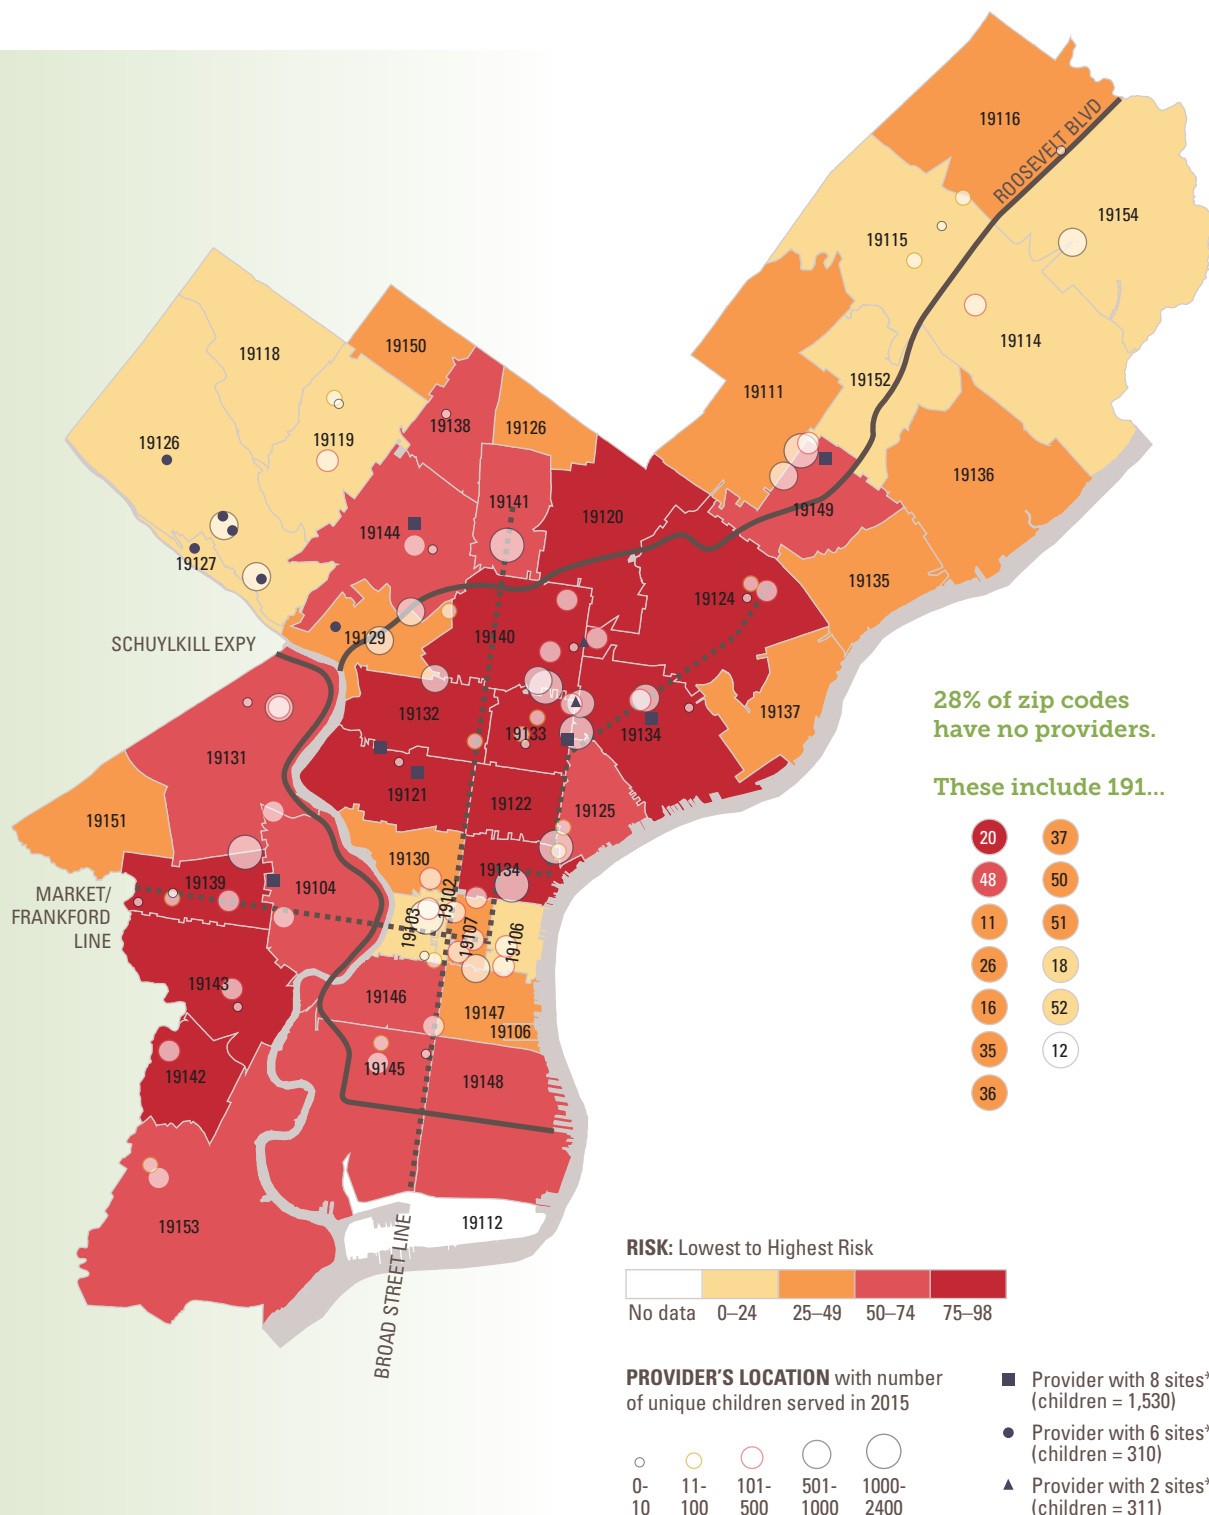

## DATA SOURCES:

2015 unique members eligible and served from Community Behavioral Health

2013 population data from the biannual Census Updates and Projections. Provided by Nielsen-Claritas, Inc., and prepared by Public Health Management Corporation's Community Health Database.

\* 3 providers serve children at multiple locations but do not specify at which location.

The Risk Index was used to compare location and utilization of outpatient mental health services available to Philadelphia's Medicaid-eligible children ages 0 to 17 years.

\* This zip code includes the Department of Human Services (DHS). Children in DHS care have this address listed as their home address but do not reside there.

## What should we do?

- 1 Increase and align the capacity of the behavioral health network according to risk and population
- 2 Adopt population health approaches to better understand neighborhood risk factors and the unevenness across Philadelphia
- 3 Use data-driven research to inform decisions on where to locate resources to increase neighborhood protective assets where they are most needed
- 4 Continue using data and cross-sector collaboration to better understand the city's evolving population and needs
- 5 Use the Risk Index to determine need as it relates to the location of other community resources like libraries, playgrounds, and physical health providers.

The ability to better understand the city from a population level allows policy makers to work toward increasing protective assets in areas that have higher risk for adverse health. Decisions driven by evidence and data, rather than instinct, would ensure a thoughtful and systematic approach to meeting the city's needs. It can strengthen the network so that the city can move beyond compliance and serve as a model for effective and efficient care for its most vulnerable citizens.

## ACKNOWLEDGEMENTS

By Quan Truong

This project would not be possible without the contribution of numerous academic and city leaders, including Dr. Longjian Liu at Drexel University's Dornsife School of Public Health Department of Epidemiology; Dr. Arthur C. Evans and Joan Erney with The Philadelphia Department of Behavioral Health and Intellectual disAbility Services/Community Behavioral Health; the Philadelphia ACE Research Committee; and the Philadelphia Department of Public Health.
